

Model CPP-T Single Row Potato Harvester

CPP-T Potato Harvestors feature a hardened vibrating digging plow share with adjustable digging depth that conveys the potatoes and soil onto a vibrating sieve grid. This separates the potatoes from the soil and deposits them in an easy to access single cut row.

Perfect for the small producer, the CPP-T Single Row Potator Harvester is a reliable and inexpensive way to get your potato crop out of the field. Optimized for use behind smaller tractors, this unit gently extracts your potatoes from the ground without bruising.

This is a "Must Have" for the organic potato grower, small producer, and serious gardener alike.

Standard Features Include:

- Hardened Long Life Digging Share
- Adjustable and Removeable Guage Wheels
- Single Lever Depth Adjustment
